

If it gets hot SPAL can cool it

SPAL was pleased to be back at Battery Tech Expo, held at Silverstone on an atmospheric racing practice day at the end of April.

As one of the smaller specialist shows, it was just right for SPAL to be there with its suite of thermal management solutions to join the rest of the exhibitors showing off the latest developments in battery technology; including testing equipment, and makers involved in battery replacement and recycling.

Within 10 minutes of arriving at the show, OEM BDM Paweł Cierniak was approached about the 12V version of the brushless drive water pump (currently in development) for a motorsport application, where the current pump used had on/off function only. There was a need for a CAN controlled solution to precisely calibrate water flow, which is exactly what the SPAL pump is designed to do.

The range of High Voltage fans attracted a lot of interest with one early adopter giving positive feedback.

Discussions were also had about cooling for new applications such as carbon reduction technology, as well as hydrogen fuel cells and the intense cooling required for data centres.

An excellent show which delivered a variety of enquiries for follow up.
